## MWM-6150 TOTAL BODY WORKOUT

**GETTING STARTED:** Always warm-up your muscles before exercising. Easy stretching (without bouncing) and light calisthenics, for several minutes, are recommended to prepare your body. A "repetition" is defined as one complete movement from the starting position, through the full range of motion, and back to the starting posi-tion. A "set" is defined as a series of continuous repetitions. Start your exercise program conservatively. Select a weight for each exercise that is easily performed for the full range of your motion. Learn to feel your body's responses and change your program accordingly. The number of repetitions for each set should range between eight and fifteen. As a general rule, the lower the number of repetitions performed (eight to ten), the heavier the resistance of weight used. While heavy resistance increases muscular strength, the full range of movement is necessary to achieve maximum muscle strength and development. Rest between each set of repetitions long enough to catch your breath. Work up to three or four sets for each isolated exercise. When you can perform the desired number of repeti-

tions at a given weight, increase the

resistance by five or ten pounds. There may be a number of exercises isolating the same muscle. These exercises should be grouped together and performed on the same day, fol lowed by a day of rest for that particular muscle.

**EXERCISE PROGRAM SUGGESTION #1** Exercise the complete body every other day, up to three times a week. The one day rest enables the body to recover from the previous workout.

**EXERCISE PROGRAM SUGGESTION #2**Alternating your daily workouts. One day isolate the upper body exercises, and the next day perform the lower body exercises. To reduce lactic acid build-up and consequently reduce muscle soreness, end each exercise with an increased number of repetitions at a lighter weight. Also, stretching the muscles is recommended upon completion of your weight resistance program.

## **WARNING!**
